

Learning about historical labor practices and economic social structures helps with our understanding of today's technological landscape. (their effects on political and economic surroundings) However, we should be ready to take extra precautions and approach them with genuine curiosity.

Developing trend: the diffusion of technology (and socialnomical trend) is often an S-curve, in which it's initial progress in the development is slow and problematic, then once a critical mass is reached, the technology flourishes, until it has saturated the market, eventually to be replaced by a newer and better approach. The prior technologies provided the foundation for the contemporary technologies, therefore learning about history provides support to help us understanding the contemporary life styles.

Historical Economic - Sustainability

In economy, sustainability is the balanced pursuit of ecological health, social equity, and economic welfare. The same pursuit exists in technological landscape, where we question the development process, the sustainability, and the implications for the greater good. When sustainability done bad, the conflict leed to migration pressures and rising inequality, which can led to bipolarized society and politics. To better understand it's effect on technological landscape, we can look into how it's influenced historical economic development moments.

Historical Social structures - Distribution

In social science, distribution bias not only is about inequality between individuals but across groups. The same can apply to technology landscape. Inequalities between gender, ethnic and

regional groups stoke social tension and affect the climate for development and hence economic growth. The fight for equality are to be appraised in historical social, economic landscapes, therefore should provide useful well-being of contemporary populations and for the technology scope as well.
